SUNO

A genre-mixing experiment

Four tracks made with AI

By Alexandre Casanova, Juna, Sam Hoyek

What is Suno?

An AI music tool

Suno generates songs and instrumentals from text prompts. You can describe a mood, genre or arrangement and supply your own lyrics.

A web app

Create and listen in your browser. Suno’s servers run the music model and return an audio track to your Library.

A tool for mashups

Use existing tracks as sources and give Suno directions about what to combine. Listen back and choose which take to keep.

Our experiment

We used Suno to explore combinations of genres that we rarely hear in the same track.

Web setup and hardware

01 Open Suno	Visit suno.com/create on a laptop or phone with internet access.
02 Sign in	Continue with a listed provider or phone number. Use the Free plan for the class demo.
03 Open Create	Select Custom and choose v6-mini in the model menu. Simple mode uses one description field.
Hardware	Use a browser and speakers or headphones. A mic is optional. Suno runs generation remotely, with no local GPU or installation required.

Access verified through sign-in. The remaining steps follow Suno’s documentation.

Plan costs and downloads

FREE

US$0

50 credits per day
v6-mini access
No song downloads

PRO

US$10 / mo

US$96 per year
2,500 credits per month
20 downloads per month

PREMIER

US$30 / mo

US$288 per year
10,000 credits per month
60 downloads per month
Includes Suno Studio

The four demo tracks are embedded on slide 9.

Listed US rates checked November 4, 2026. Taxes and local pricing may vary.

Audio playback, selection and edits

Suno offers v6, v6-wild and v6-mini. Its public v6 materials do not disclose whether the music models use transformers, diffusion or a hybrid, or which hardware or outside APIs they use.

Suno’s separate open-source Bark model uses transformers for text-to-audio. Bark’s design does not establish how v6 works.

How Suno trains its music models

1. Gather examples	Suno reports using tens of millions of publicly accessible music files and related text metadata. Some recordings may be copyright-protected.
2. Prepare the data	Suno organizes, cleans, and filters the collected data before training to remove low-quality material.
3. Learn from audio and text	The examples help the model connect descriptions, such as genres, with how the music sounds. Suno says some later training datasets may also include user content and activity.
What v6 leaves open	Suno describes its data sources at a high level. Its public materials leave the exact v6 dataset, architecture, and training procedure unspecified.

The prompt is the main control

What we specify	Style, mood, instrumentation and lyrics. For a mashup, we also choose the source tracks and adjust the sliders.
What we decide	Which take to keep, what to change in the prompt, and whether to regenerate or edit a section.
Easy to explore	Hear a complete arrangement quickly and compare multiple treatments of the same idea.
Hard to control	Exact notes, bar counts and syllable timing. The generated track starts as a single mix.

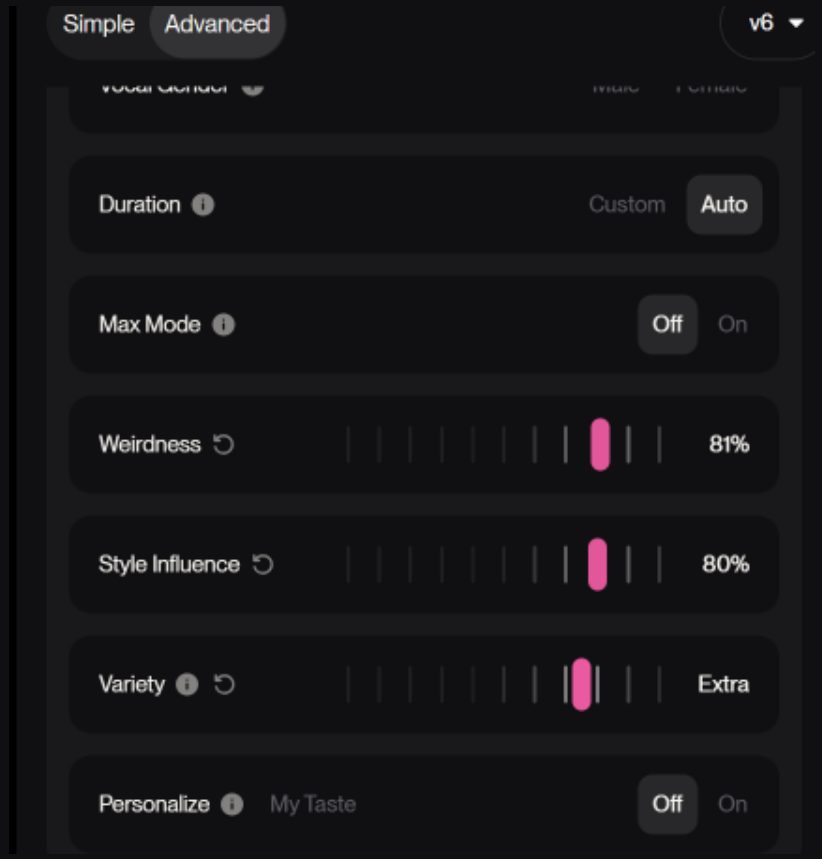

Our genre-mixing experiment

Could Suno blend styles we rarely hear together?

We tried combining mariachi, Latin pop, orchestral music, rock, Afrobeats, big band and EDM across four tracks.

We mostly used Mashup, pairing tracks and changing Weirdness, Style Influence and Variety to explore different blends.

Listen for what carries over from The Final Stand into the final mashup.

One settings example from the experiment

Listen to the four tracks

01 The Final Stand

02 Mariachi Techno × Raise It Up (Mashup)

03 Raise It Up, Pass It Around × Bri... (Mashup)

04 Mariachi Techno × Raise It Up × The Final Stand (Mashup)

Select a play icon in Slide Show to hear its track.

Failure cases and output bias

Prompt drift	Listen for missing instruments, an unexpected voice, or a transition that lands too early or late.
Audio artifacts	Check for garbled words, smeared instruments, abrupt endings or audible seams after an edit.
Genre and language bias	Test whether the model falls back on genre clichés or handles accents, languages and regional styles unevenly.
A small comparison	Reuse the prompt and change one instruction. Compare two takes for prompt fit, clarity and unexpected changes.

These are listening tests. Add an observed example and timestamp after generation.

Model and output rights

Model access	The v6 music models are offered as a hosted service. The separate Bark project has an MIT license.
Free output	Suno limits free output to lawful personal, noncommercial use. The current Free plan lists no song downloads.
Paid output	Pro and Premier can commercially use eligible output via an approved download, subject to the terms. Suno does not guarantee copyright.
Your inputs	Submit lyrics and audio you have rights to use. Suno’s terms grant it a broad license, including use for model improvement.

Privacy and security

What Suno receives	Prompts, lyrics, files and recordings you submit, plus account, device and usage information.
Where it goes	Suno processes it on its service. Its policy describes sharing with service providers and use for service improvement.
Device access	A text-only run needs no microphone. Recording uses the mic if you grant access. Uploading sends the file you select.
Who can listen	Anyone with the Link-Only URL can open the song. Use original text and leave sensitive recordings out of the demo.

A soundtrack for our final project

Where it fits	Use Suno to audition mood and instrumentation for a short video or interactive scene.
What we would add	Edit the cue to picture or make a clean loop in an audio editor. Keep a record of the prompt, model and rights.
What could go wrong	Music may miss a cue, compete with dialogue, or be difficult to loop. Download and usage rights depend on the plan.
What we would test	Play it in the project. Check timing, dialogue clarity and whether the intended release needs commercial rights.

Example application for our group’s final project.

Can students train a model?

Suno's public API	The documented API checks whether audio carries Suno's content credentials. We found no public API for training or fine-tuning Suno.
Custom Models in Suno	Pro and Premier users can upload at least six songs they have the rights to use. Suno handles training and keeps the custom model private.
Training with code	Meta's AudioCraft MusicGen publishes training code and noncommercial model weights. Use recordings you have permission to train on.
A project experiment	Compare the base and fine-tuned MusicGen models using the same genre-mixing prompts. Listen for which genre cues carry through.

Our four demo tracks are below Suno's six-song minimum.
